

# Whatman Mini-UniPrep Syringeless Filters

## Instructions for use

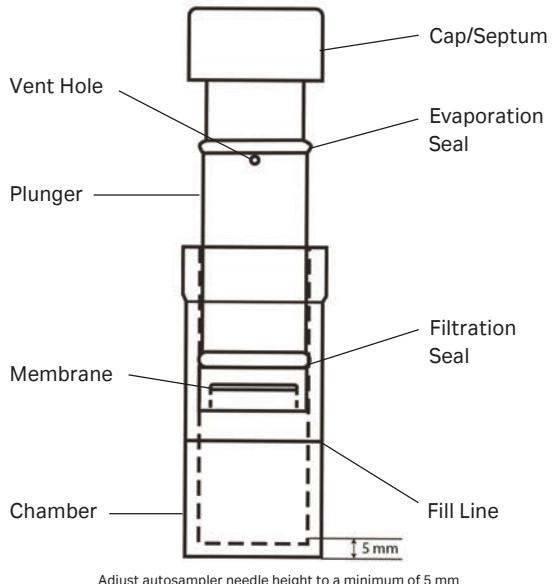

### Introduction

#### Important

Read these instructions carefully before using the products.

#### Intended use

The products are intended for research use only, and shall not be used in any clinical or *in vitro* procedures for diagnostic purposes.

Mini-UniPrep™ Syringeless Filters are preassembled filtration devices for removing particulates from samples. They replace syringe filters, syringes and autosampler vials/septa/caps with a single, disposable unit.

Each Mini-UniPrep consists of two parts: a chamber and a plunger. The design incorporates a filtration membrane on one end of the plunger and a preattached cap/septum on the other. By pressing the plunger through liquid placed into the chamber, positive pressure forces the filtrate up into the reservoir of the plunger. Air escapes through the vent hole until the evaporation seal is engaged providing an airtight seal.

The Mini-UniPrep can be used with any autosampler that takes standard (12mm x 32mm profile) 2 ml vials for automated sample injection into your instrument.

### Safety Precaution

*Do not overfill the Mini-UniPrep or compress the device at an angle before the airtight seal is made. Liquid could escape out of the air vent holes, resulting in the loss of sample or personal injury.*

### Instructions for Use

- | Step | Action  |
|------|---|
| 1    | Select the Mini-UniPrep Syringeless Filter that is compatible with your sample. (See <i>Chemical Compatibility Guide</i> .) If your solvent is not listed, see <a href="http://cytiva.com/contact">cytiva.com/contact</a> for Technical Support contact details. Add sample to be filtered to the chamber. <b>Be careful not to exceed the fill line.</b> Each Mini-UniPrep has a capacity of approximately 0.4 mL. |
| 2    | Insert a plunger into each Mini-UniPrep chamber until the membrane contacts the liquid. If filtering manually without the Compressor; slowly compress the plunger and chamber with your thumb and forefinger until the evaporation seal is fully engaged.   |
| 3    | The Mini-UniPrep prepared sample is ready for analysis. Process in either of two ways: <ol style="list-style-type: none"> <li>Place the Mini-UniPrep into a suitable autosampler for automated sample injection into your instrument.</li> <li>Pierce the septum and draw the filtered sample into a syringe for manual injection into your instrument.</li> </ol>  |

### Ordering Information – Whatman Mini-UniPrep Syringeless Filters

## Membrane Guide

Type	Applications
<b>Glass Microfiber (GMF)</b>	High loading capacity, binder-free, glass microfiber depth filter medium.
<b>Nylon (NYL)</b>	Membrane for aqueous and organic samples within a pH range of 3-10.
<b>Polyethersulfone (PES)</b>	For aqueous-based samples. Good flow rates.
<b>Polypropylene (Dp PP)</b>	Aqueous and organic samples; high loading capacity depth filter.
<b>Polypropylene (PP)</b>	For solvent-based samples, low water breakthrough values.
<b>Polytetrafluoro-ethylene (PTFE)</b>	For aggressive samples. Great chemical compatibility.
<b>Polyvinylidene difluoride (PVDF) (Hydrophilic)</b>	Low nonspecific protein binding membrane for samples in aqueous solutions or organic solvents.
<b>Regenerated Cellulose (RC)</b>	Suitable for use with either aqueous or organic solvents. Very low nonspecific protein binding membrane.
